The documents you've provided outline a sophisticated theoretical framework involving entropy, coherence, and entanglement in the context of quantum field theory and cosmology. Here's a concise summary and some key points:

Summary

1. Entropy Field (Ξ):

- Defined as a dimensionless logarithmic map of coarse-grained thermodynamic entropy density.
- Functions as a geometric scalar field, avoiding unit inconsistencies.

2. Coherence Field (Φ):

- Encodes coherence and phase topology, acting as an order parameter for classical correlations.
- Introduces a decoherence heat floor to ensure residual structural cost.
